**Remarks:** For explanations on data summarization methods, abbreviations and other pertinent information, please see the comments in the introduction to the Regional Variety Trials. Fusarium Head Blight (FHB) infection is highly influenced by the environment and heading date. Under high levels of FHB all varieties will sustain damage. Moderately Resistant (MR) and Resistant (R) ratings for FHB do not equate to immunity. Varieties rated Intermediate (I) to Susceptible (S) for bunt should be treated with a systemic seed treatment to reduce the potential for infection. AAC Oakman VB has a solid stem that confers resistance to wheat stem sawfly. CDC Adamant VB and CDC Landmark VB have a semi-solid stem that confers resistance to the wheat stem sawfly. CL - CDC Abound, CDC Pilar CLPlus, and CDC Succession CLPlus VB are tolerant to the CLEARFIELD® herbicides Adrenalin SC and Altitude FX. VB - designates a varietal blend to preserve the Sm1 orange wheat blossom midge tolerance gene. New registrations and insufficient data to describe: AAC Ahead VB (BW1141), AAC Rivers VB (BW1143), CDC Power CL Plus (PT5008). ☼ = PBR Protection under UPOV 78, ☼ = PBR protection under UPOV 91, and ☼\* = PBR application filed and subject to provisional protection. VUA = Variety Use Agreement applied (<http://seeds-canada.ca/variety-use-agreement/>). NT - Not tested. + Flagged for possible removal in 2027.

**Remarks:** For explanations on data summarization methods, abbreviations and other pertinent information, please see the comments in the introduction to the Regional Variety Trials. Fusarium Head Blight (FHB) infection is highly influenced by the environment and heading date. Under high levels of FHB all varieties will sustain damage. Moderately Resistant (MR) and Resistant (R) ratings for FHB do not equate to immunity. Varieties rated Intermediate (I) to Susceptible (S) for bunt should be treated with a systemic seed treatment to reduce the potential for infection. VB - designates a varietal blend to preserve the Sm1 orange wheat blossom midge tolerance gene. AAC Brandon is included for direct comparison of CPSR varieties with AAC Brandon. Please note that AAC Brandon is a variety classified under CWRS. New registrations and insufficient data to describe: UA Brynn (HY2161).  = PBR Protection under UPOV 78,  = PBR protection under UPOV 91, \* = PBR application filed and subject to provisional protection, and **VUA** = Variety Use Agreement applied (<http://seeds-canada.ca/variety-use-agreement/>). NT - Not tested.

**Remarks:** For explanations on data summarization methods, abbreviations and other pertinent information, please see the comments in the introduction to the Regional Variety Trials. In 2024, the check cultivar was changed to AC Andrew. All previously tested varieties were adjusted relative to AC Andrew. Varieties rated Intermediate (I) to Susceptible (S) for bunt should be treated with a systemic seed treatment to reduce the potential for infection. VB - designates a varietal blend to preserve the Sm1 orange wheat blossom midge tolerance gene. Plant Breeders Rights: ☞ = PBR Protection under UPOV 78 and ☞ = PBR protection under UPOV 91, ☞\* = PBR application filed and subject to provisional protection. NT - Not tested. AAC Brandon is included for direct comparison of SWS varieties with AAC Brandon. Please note that AAC Brandon is a variety classified under CWRs.

# CANADA WESTERN AMBER DURUM WHEAT

Remarks: For explanations on data summarization methods, abbreviations and other pertinent information, please see the comments in the introduction to the Regional Variety Trials. In 2024, the check cultivar was changed to AAC Schrader. All previously tested varieties were adjusted relative to AAC Schrader based on the relative difference between AAC Schrader and Strongfield since 2010. Generally, durum wheat is best adapted to southern Alberta. Outside of this area, durum tends to be late maturing and often subject to quality loss. Durum varieties are generally more susceptible to Fusarium Head Blight than CWRS wheat varieties. AAC Grainland, AAC Stronghold, CDC Fortitude and AAC Weyburn VB have a solid stem that confers resistance to the wheat stem sawfly. VB - designates a varietal blend to preserve the Sm1 orange wheat blossom midge tolerance gene. \* - CDC Flare is tolerant to the CLEARFIELD® herbicides Adrenalin SC and Altitude FX. New registrations and insufficient data to describe: AAC Burton (DT2046). ☼ = PBR Protection under UPOV 78, ☼ = PBR protection under UPOV 91, and ☼\* = PBR application filed and subject to provisional protection. NT - Not tested. + Flagged for possible removal in 2027.

Remarks: For explanations on data summarization methods, abbreviations and other pertinent information, please see the comments in the introduction to the Regional Variety Trials. In 2023, the check cultivar was changed to AAC Synergy. All previously tested varieties were adjusted relative to AAC Synergy based on the relative difference between CDC Copeland and AAC Synergy since 2015. Varieties rated Intermediate (I) to Susceptible (S) for smuts should be treated with a systemic seed treatment to reduce the potential for infection. ☼ = PBR Protection under UPOV 78, ☼ = PBR protection under UPOV 91, ☼\* = PBR application filed and subject to provisional protection, and VUA= Variety Use Agreement applied (<http://seeds-canada.ca/variety-use-agreement/>). XX - Insufficient data to describe. Approved ratings will be posted online at seed.ab.ca. + Flagged for possible removal in 2027.

Remarks: For explanations on data summarization methods, abbreviations and other pertinent information, please see the comments in the introduction to the Regional Variety Trials. In 2023, the check cultivar was changed to AAC Synergy. All previously tested varieties were adjusted relative to AAC Synergy based on the relative difference between CDC Copeland and AAC Synergy since 2015. Varieties rated Intermediate (I) to Susceptible (S) for smuts should be treated with a systemic seed treatment to reduce the potential for infection. New registrations and insufficient data to describe: AB Foothills (TR20661), CDC Armstrong (HB20351), CDC Pristine (HB21355). Glycosidic nitriles (GN) is a precursor to ethyl carbamate, a compound that is a concern in the fermentation process but becomes an amplified concern in the distilling process. The Canadian Malting Barley Technical Centre (CMBTC) evaluates and recommends malting barley varieties for industry acceptance. Please refer to the 2025-2026 CMBTC Recommended Malt Barley Varieties List for more information.  = PBR Protection under UPOV 78,  = PBR protection under UPOV 91,  = PBR application filed and subject to provisional protection, and **VUA** = Variety Use Agreement applied (<http://seeds-canada.ca/variety-use-agreement/>). <sup>†</sup> Flagged for possible removal in 2027.

Remarks: For explanations on data summarization methods, abbreviations and other pertinent information, please see the comments in the introduction to the Regional Variety Trials. Varieties rated Intermediate (I) to Susceptible (S) for the smuts should be treated with a systemic seed treatment to reduce the potential for infection. CDC Westgate and CDC Nasser are special forage oat varieties with low acid-detergent lignin content resulting in greater digestibility for cattle. New registration and insufficient data to describe: AAC Fetch (OT2148), AAC Gladys (OT2152).  = PBR Protection under UPOV 78,  = PBR Protection under UPOV 91, and  = PBR application filed and subject to provisional protection. **VUA** = Variety Use Agreement applied (<http://seeds-canada.ca/variety-use-agreement/>). XX - Insufficient data to describe. Disease ratings for some NT lines will be reviewed and approved at the Prairie Recommending Committee for Oat and Barley meetings in February 2026. <sup>†</sup> Flagged for possible removal in 2027.

Remarks: For explanations on data summarization methods and other information, please see the comments in the introduction to the Regional Variety Trials. Awn description: Y = awns present, R = reduced awn. Triticale varieties are generally rated as fair to poor for their falling number. All varieties exhibit varying levels of susceptibility to ergot, influenced by genetic factors and environmental effects. Current testing may not adequately distinguish genetic resistance from external factors such as weather conditions, crop development stage, inoculum load, and management practices. New registrations and insufficient data to describe: WCI Widdicombe (T301).  = PBR Protection under UPOV 78,  = PBR protection under UPOV 91, \* = PBR application filed and subject to provisional protection. XX - Insufficient data to describe. Triticale varieties have greater susceptibility to ergot infection than wheat.

Remarks: For explanations on data summarization methods, abbreviations and other pertinent information, please see the comments at the beginning of this publication. Winter wheat can be grown successfully in all areas of Alberta if seeded into standing stubble within the optimal seeding date period (generally before September 15) and if there is adequate snowfall. Varieties with poor (P) winter survival are generally not suitable outside of southern Alberta. The long term average maturity for AAC Coldfront is 219.1 days after Jan. 1 (Aug. 8) and is considered to be late maturing. Fusarium head blight infection may be reduced if varieties with Intermediate (I) resistance or better are used and when recommended seeding dates are followed. To preserve the effectiveness of the wheat curl mite tolerance gene, agronomic practices that eliminate the "green bridge" of plant material that serves as a reservoir for mites should be followed whenever possible. Fields in southern Alberta should be inspected in the fall for infestation by Russian wheat aphid, as it may reduce winter survival. AAC Wildfire expresses tolerance to some biotypes of Russian wheat aphid. Radiant and AAC Wildfire express bronze chaff at maturity. AAC Icefield, a hard white winter wheat, expresses high milling yield of very white flour and good gluten strength at lower protein concentrations that may be of interest in some niche markets. For more information contact FP Genetics. Pintail has an awnless head which may improve palatability when harvested for forage or silage. ☞ = Protected by PBR (UPOV 78), ☞ = Protected by PBR (UPOV 91), Yield and agronomic data only directly comparable to AAC Coldfront ☞\* = pending PBR protection.

Remarks: For explanations on data summarization methods, abbreviations and other pertinent information, please see the comments in the introduction to the regional variety trials. Data are derived from registration trials conducted in Alberta, supplemented by Saskatchewan data where appropriate. Data from 2025 were not available at the time of table preparation. Hazlet has lower viscosity which improves feed performance in monogastric livestock. Fall rye generally has greater cold tolerance than winter wheat and winter triticale. The long-term average heading and maturity dates for Hazlet are June 8 and August 5 (217 d after Jan 1), respectively. All fall rye varieties are similar for heading date. Sprouting is a major factor in marketing rye for milling and is generally measured using the Hagberg falling number test. There is considerable variation in fall rye varieties for falling number that should be considered if milling markets are targeted. Typically, a falling number of 180 seconds or greater is preferred by the rye milling market. Falling number is heavily influenced by moisture around harvest time so producers should ensure that rye is harvested in a timely manner, similar to wheat crops. All fall rye varieties are susceptible to ergot, however KWS Daniello, KWS Serafino, KWS Trebiano, KWS Sandor and Prima have reduced susceptibility to natural ergot infection compared with Hazlet. AFSC crop insurance deadlines for seeding fall rye is September 20, north of the Bow River and September 30, south of the Bow River. ☪ = PBR protection under UPOV 91. ☪\* = PBR application filed and subject to provisional protection. VUA = Variety Use Agreement applied (<http://seeds-canada.ca/variety-use-agreement/>).

Remarks: For explanations on data summarization methods, abbreviations and other pertinent information, please see the comments in the introduction to the regional variety trials. All data is derived from registration trials conducted in Alberta and appropriate sites from Saskatchewan; 2025 data were not available at the time of table preparation. Yield comparisons include direct and indirect comparisons with the check. Winter triticale is similar in winter survival to winter wheat. The long term heading and maturity dates for Metzger are June 17 and August 4 (168 days and 216 days after Jan. 1), respectively. Awn description: Y = awns present, R = reduced awn. Triticale varieties have greater susceptibility to ergot infection than wheat. Bobcat has greater susceptibility to ergot infection than other winter triticale varieties.  PBR Protection under UPOV 78,  PBR protection under UPOV 91,  \* PBR application filed and subject to provisional protection. XX - Insufficient data to describe.

Remarks: For explanations on data summarization methods, abbreviations and other pertinent information, please see the comments in the introduction to the Regional Variety Trials. All listed varieties are immune to flax rust and MR to Fusarium wilt. NT - Not tested for disease, until a full rating is assigned, assume a variety poses a risk of susceptibility. Due to flax being a small acre crop and limited flax testing in Alberta, data included in this table is heavily weighted on Saskatchewan registration data. XX - Insufficient data to describe. ☼ = PBR Protection under UPOV 78, ☼ = PBR protection under UPOV 91, and ☼\* = PBR application filed and subject to provisional protection. † Flagged for possible removal in 2027.

**Remarks:** For explanations on data summarization methods and other information, please see the comments in the introduction to the Performance Variety Trials. Yield is reported in wet tons/acre adjusted to 65% moisture. Barley silage trials are harvested when 75% of the barley varieties are at soft dough, BBCH 85. Relative maturity is given as physiological grain maturity. Due to re-structuring the silage RVTs, yield data is only presented if there are six site years of data. Beginning in 2023, irrigated and dryland experimental sites were run. Due to limited amounts of irrigated data, only overall provincial yield will be presented until sufficient data is available to populate both dryland and irrigated yield columns. Awn Types: H = Hooded, S = smooth, SS = Semi-smooth, R = Rough. Nutritional data is presented on a dry matter basis (%DM). CP = Crude Protein; ADF = Acid Detergent Fibre; NDF = Neutral Detergent Fibre; TDN = Total Digestible Nutrient; and Invitro True Digestibility at 30H. Prior to 2023 a limited number of nutritional parameters were tested; varieties in the tests prior to 2023 do not have a full complement of nutritional data, indicated by NT = not tested. Please see disease tolerance ratings in the barley grain tables. Insufficient data to describe: CDC Harness (FB21106), FB23618, Ferguson.  = PBR Protection under UPOV 78,  = PBR protection under UPOV 91,  = PBR application filed and subject to provisional protection, **VUA** = Variety Use Agreement Applied (<http://seeds-canada.ca/variety-use-agreement/>). <sup>+</sup> Flagged for possible removal in 2027.

**Remarks:** For explanations on data summarization methods and other information, please see the comments in the introduction to the Performance Variety Trials. Yield is reported in wet tons/acre adjusted to 65% moisture. Oat silage trials are harvested when 75% of the varieties are at milk stage, BBCH 75. However, the 2023 and 2024 trials contained varieties with a wide range of development, with some locations showing a week or more difference in growth stages. This results in some of the later maturing varieties having lower yield and altered quality. Relative maturity is based on physiological grain maturity and may vary by up to six days. Due to re-structuring the silage RVTs, yield data is only presented if there are six site years of data. Beginning in 2023, irrigated and dryland experimental sites were run. Due to limited amounts of irrigated data, only overall provincial yield will be presented until sufficient data is available to populate both dryland and irrigated yield columns. Nutritional data is presented on a dry matter basis (%DM). CP = Crude Protein; ADF = Acid Detergent Fibre, NDF = Neutral Detergent Fibre, TDN = total digestible nutrient ; Invitro True Digestibility at 30H. Prior to 2023 a limited number of nutritional parameters were tested; varieties in the tests prior to 2023 do not have a full complement of nutritional data, indicated by NT = not tested. Please see disease tolerance ratings in the oat grain tables. ☹ = PBR Protection under UPOV 78, ☹= PBR protection under UPOV 91. ☹\* = PBR application filed and subject to provisional protection. † Flagged for possible removal in 2027. CDC Westgate, CDC Nasser and CDC SO-1 are specialty forage oat variety with low acid-detergent lignin content resulting in greater digestibility for cattle.

**Remarks:** For explanations on data summarization methods and other information, please see the comments in the introduction to the Performance Variety Trials. Yield is reported in wet tons/acre adjusted to 65% moisture. Wheat-triticale silage trials are harvested when 75% of the wheat varieties are at early to soft dough, BBCH 83-85, and the triticale varieties are at late milk, BBCH 77. Relative maturity is given as physiological grain maturity. Due to re-structuring the silage RVTs, yield data is only presented if there are six site years of data. Beginning in 2023, irrigated and dryland experimental sites were run. Due to limited amounts of irrigated data, only overall provincial yield will be presented until sufficient data is available to populate both dryland and irrigated yield columns. Please see disease tolerance ratings in the triticale and wheat grain tables. Nutritional data is presented on a dry matter basis (%DM). CP = Crude Protein; ADF = Acid Detergent Fibre, NDF = Neutral Detergent Fibre, TDN = total digestible nutrient; Invitro True Digestibility at 30H; VB = designates a varietal blend to preserve the Sm1 orange wheat blossom midge resistance gene. Prior to 2023 a limited number of nutritional parameters were tested; varieties in the tests prior to 2023 do not have a full complement of nutritional data, indicated by NT = not tested. Please see disease tolerance ratings in the wheat and triticale grain tables. Insufficient data to describe: CDC Bandit, WCI Widdicombe (T301), T317. ☉ = PBR Protection under UPOV 78, ☉ = PBR protection under UPOV 91. ☉\* = PBR application filed and subject to provisional protection.

**Remarks:** All colored flower types have seed coats that contain tannins and may be suitable for export food markets if seed size and quality match customer demand. Varieties tested for a minimum of three years are considered fully tested. XX = Insufficient data. NA = data is not available.  = PBR protection under UPOV 91 and  \* = PBR application filed and subject to provisional protection. <sup>1</sup>Flower Colour: W = white flower, low tannin; C = colored flower, tannin.

**Remarks:** Weight, diameter and thickness of lentil seeds were dependent upon environmental conditions and agronomic factors. CL® = Clearfield® variety. <sup>Ⓢ</sup> = PBR protection under UPOV 91, and <sup>Ⓢ</sup>\* = PBR application filed and subject to provisional protection. VUA = Variety Use Agreement applied (<http://seeds-canada.ca/variety-use-agreement/>). XX = Insufficient data, minimum requirement for a variety is 6 site years and 2 years of testing. Due to limited regional variety trial data, registration yield data from Alberta sites beginning in 2015, has been included to increase the number of site-years. New registration with insufficient data to describe: CDC 7358 (CL). <sup>1</sup>Yields are reported relative to CDC Maxim (CL). CDC Maxim belongs to Small Red Market Class. <sup>2</sup>Thousand Seed Weight. <sup>3</sup>Maturity: E = Early, M = Medium, L = Late. <sup>4</sup>Cotyledon Color: R = Red, Y = Yellow; <sup>5</sup>Seed Coat Color/Patterns: G=Green, GR=Grey. <sup>6</sup>Disease tolerance to Ascochyta and Anthracnose - Race 1 (note: there is no genetic resistance to Race 0); S = Susceptible, MR = Moderately Resistant.
